

Dr Xavier Speaks at Annual BCAM Doctors' Conference about The Power of Polynucleotides in Skin and Hair Rejuvenation

Dr Xavier was again invited to speak at the annual conference of the British College of Aesthetic Medicine (BCAM) in London on September 30th.

BCAM is the officially recognised Body representing doctors in this specialty.

Dr Xavier was asked to present about Polynucleotides which are the latest revolutionary tools in regenerative medicine that work on a cellular level to repair tissue, boost skin quality, and encourage hair regrowth.

His lecture not only covered the science behind polynucleotides, sharing multiple clinical studies that support their efficacy for use on the skin, hair, body and female intimate area, but also explaining the protocols for optimum results.

Polynucleotides work by stimulating fibroblasts in the skin to repair damaged and aged cells through a series of injectable treatments and they are now an essential regenerative tool for practitioners looking to enhance aesthetic results.

In our clinic we love the results we get!
